Afternoon Liz,

Here is my request for sound levels from Mr Heller.

I wish to know the L10 and L50 levels for the sound surveys taken. The L90 has been provided, commonly referred to as 'background noise'.

I am requesting the L10 and L50 values.

Here is some background info:

“ L_{10} , L_{50} and L_{90}

The commonly used value of n for the n-percent exceeded level, L_n , are 10, 50, and 90.

L_{10} is the level exceeded for 10% of the time. For 10% of the time, the sound or noise has a sound pressure level above L_{10} . For the rest of the time, the sound or noise has a sound pressure level at or below L_{10} . These higher sound pressure levels are probably due to sporadic or intermittent events.

L_{50} is the level exceeded for 50% of the time. It is statistically the mid-point of the noise readings. It represents the median of the fluctuating noise levels.

L_{90} is the level exceeded for 90% of the time. For 90% of the time, the noise level is above this level. It is generally considered to be representing the background or ambient level of a noise environment.

For a varying sound, L_{10} is greater than L_{50} which in turn is greater than L_{90} . The following graph illustrates L_{10} , L_{50} and L_{90} .

Please note that $L_{10} > L_{50} > L_{90}$ for the same sound or noise.

Good afternoon Ms. Burdick:

Can you get me further clarification on Commissioner Wood's question concerning the L10 sound level, preferably in writing. I want to be sure that I convey the exact nature of the question to our sound consultant to enable him to answer intelligently. I have a meeting with our consultants on Monday at 11. If you could get this to me before then, it would be greatly appreciated.
