RE: Wetland Delineation –7 Lorenz Industrial Parkway, Ledyard, Connecticut.

Dear Mr. Gardner:

I completed a wetland survey of the above referenced 2.37 -acre parcel. The purpose of this survey was to document all on-site jurisdictional wetlands and watercourses.

Wetland Delineation Methodology

A soil survey and wetland delineation were completed in accordance with the standards of the Natural Resources Conservation Services (NRCS) National Cooperative Soil Survey and the definitions of inland wetlands and watercourses as found in the Connecticut General Statutes, Chapter 440, Sections 22a-36 through 22a-45 as amended. Wetlands, as defined by the Statute are those soil types designated as poorly drained, very poorly drained, floodplain or alluvial in accordance with the NRCS National Cooperative Soil Survey. Such areas may also include disturbed areas that have been filled, graded, or excavated and which possess an aquic (saturated) soil moisture regime.

Watercourses means rivers, streams, brooks, waterways, lakes, ponds, marshes, swamps, bogs, and all other bodies of water, natural or artificial, vernal, or intermittent, public, or private, which are contained within, flow through or border upon the Town of Ledyard or any portion thereof not regulated pursuant to sections 22a-28 through 22a-35, inclusive, of the Connecticut General Statutes. Intermittent watercourses are defined permanent channel and bank and the occurrence of two or more of the following characteristics: (a) evidence of scour or deposits of recent alluvium or detritus, (b) the presence of standing or flowing water for duration longer than a particular storm incident, and (c) the presence of hydrophytic vegetation.

Wetland Delineation Results

The on-site soil survey was completed on May 10, 2020 to examine the upper 20" of the soil profiles for the presence of hydric soil conditions and delineate any wetland and/or watercourse boundaries located on the property.

The wetlands on the subject property occupy most of the eastern half of the property. The wetland boundary is well-defined, following along the toe-of-slope. The wetlands quickly give rise to the adjacent developed lands. The wetlands are classified as a red maple (*Acer rubrum*) forested wetland with a forest floor carpeted in skunk cabbage (*Symplocarpus foetidus*) and is associated with an intermittent watercourse that flows through the center of the wetland. Where the Eversource Powerline Rights-of-Ways (ROW) vegetation is maintained, the wetland is dominated by a Phragmites stand and low-lying scrub wetland vegetation.

Sequentially numbered wetland flags, 1 to 18 and 1A to 13A represent the wetland limits as flagged in the field. Figure 1 illustrates the approximate flag locations. The provided figure is for planning purposes only and the field location and subsequent mapping supersedes this sketch.

Figure 1: Wetland Sketch

Photo 1: Red Maple Forested Swamp

Photo 2: Phragmites Wetland / Powerline ROW

Soil Survey

The soils identified on the site are a refinement of the Natural Resources Conservation Service (NRCS) Websoil survey (See attached).

Wetlands soils along the wetland boundary are mapped and classified as (3) Ridgebury, Leicester, and Whitman fine sandy loams. The poorly drained soils along the wetland boundary belong to the Ridgebury and Leicester soil series. Ridgebury and Leicester soils are found within drainageways and depressions on glacial till landscapes. Ridgebury and Leicester soils have a seasonal high-water table at a depth of about 6 inches.

A typical soil profile along the wetland boundary consists of approximately 3"-0" of intermediately decomposed organic material (Oi), followed by 0"-6" of a thick dark topsoil horizon (A), underlain by 6"-18" of a wet weakly developed grayish subsoil horizon (Bg) with common redoximorphic features (Common medium distinct strong brown mottles, masses) ranging from fine sandy loam to very fine sandy loam. This subsoil is underlain by a saturated sandy loam to fine sandy loam gray substratum (2Cg).

The developed upland areas are classified as Urban land complex which contains miscellaneous soil types that are present on the landscape in a complex pattern that is not practical or necessary to separate. Urban land is used to denote well drained earthen material which has been so disturbed by cutting, filling, or grading, that the original soil profile can no longer be discerned and are co-associated with buildings, roads, parking lots and landscaping of highly developed areas. The undisturbed naturally occurring soils are mapped and classified as well-drained Charlton – Chatfield soil complex. It is noteworthy that shallow depth to bedrock in Chatfield soils can be a limiting factor for development.

Soil Map—State of Connecticut
(7 Lorenz Industrial Pkwy)

Soil Map may not be valid at this scale.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:12,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: State of Connecticut
Survey Area Data: Version 20, Jun 9, 2020

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Mar 20, 2019—Mar 27, 2019

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

DRAINAGE ANALYSIS

Land Use Department

CONSTRUCTION OF THE PROPOSED BUILDING AND NEW PAVED PARKING AREA WILL INCREASE THE IMPERVIOUS SURFACES BY 3,700 SQ FT. (0.085 ACRES)

USING THE RATIONAL METHOD: $Q = A \times I \times R$

A (AREA IN ACRES)

I (IMPERVIOUS COEFFICIENT) = 0.9 PAVEMENT/ROOF
= 0.25 LAWN/VEGETATION

R (RAINFALL RATE INCHES/HOUR)

10 MINUTE TIME OF CONCENTRATION $R = 5.5 \text{ IN/HR}$

Q 25 YR EXISTING $0.085 \times 0.25 \times 5.5 = 0.12 \text{ CFS}$

Q 25 YR PROPOSED $0.085 \times 0.90 \times 5.5 = 0.42 \text{ CFS}$

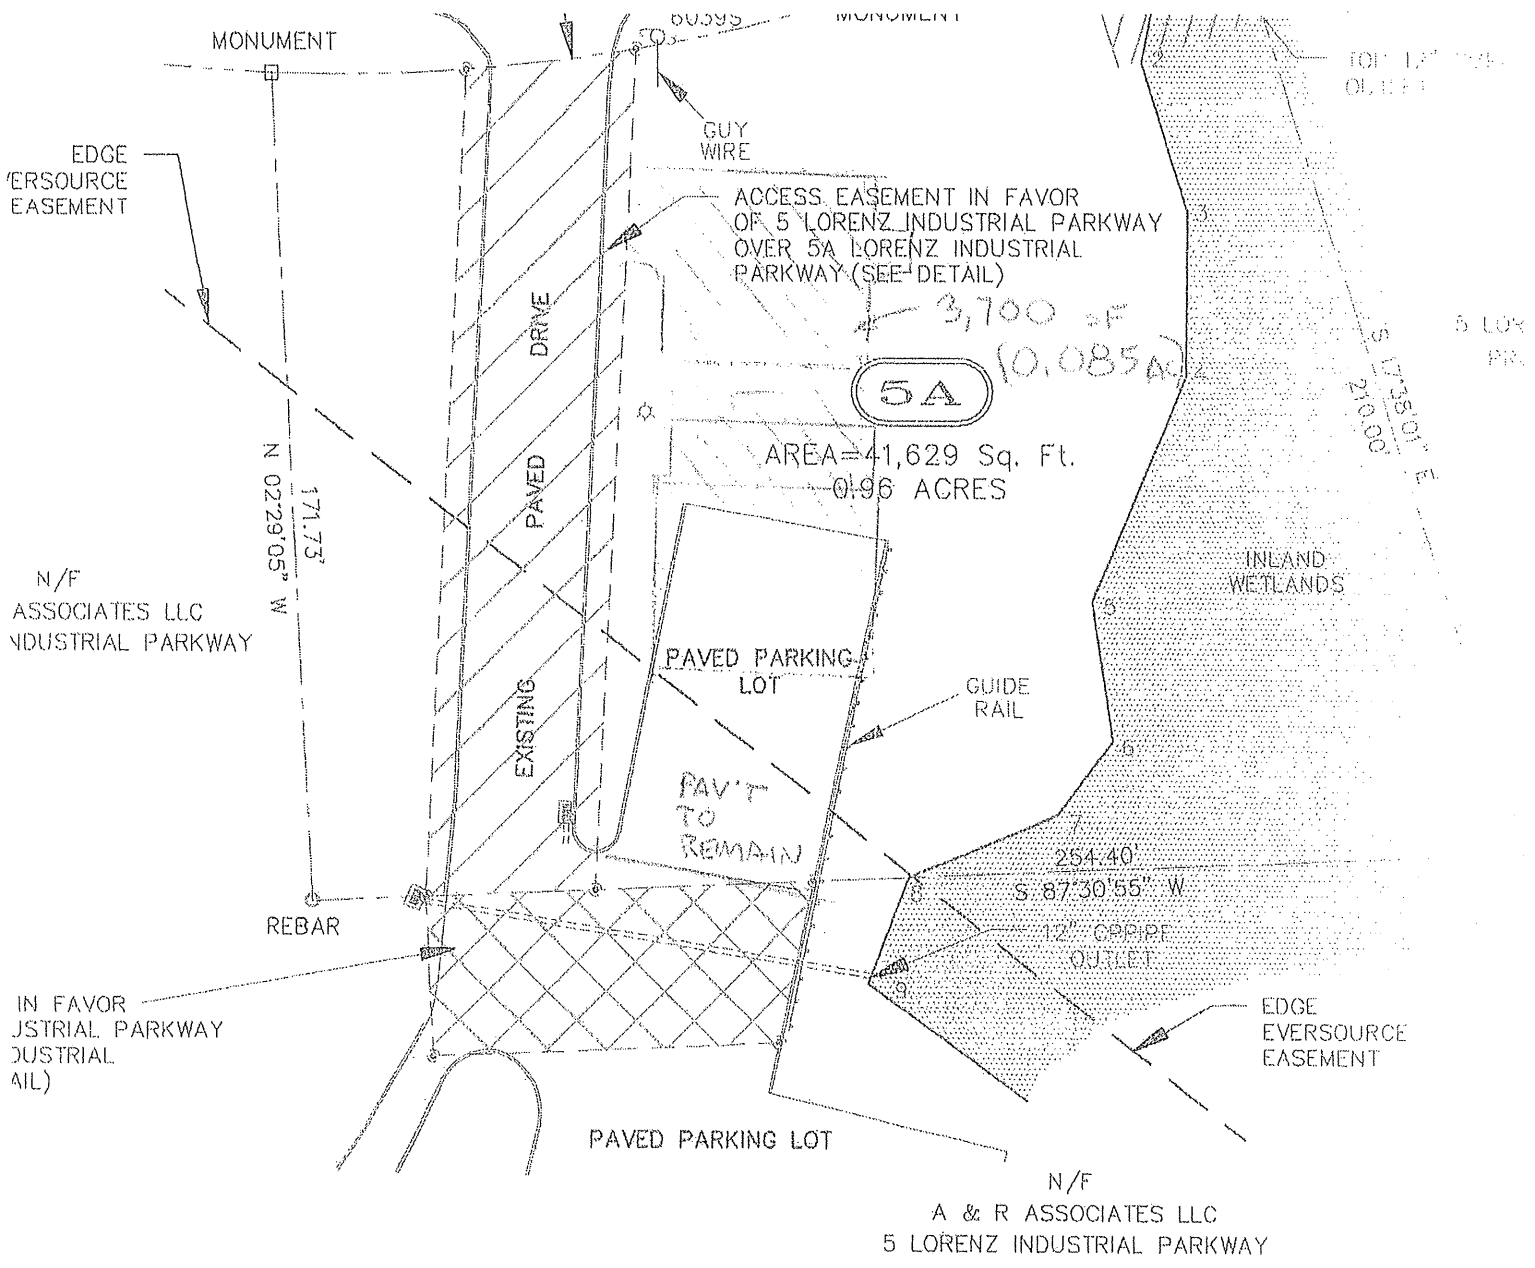

Q 25 YR INCREASE 0.30 CFS

CONCLUSION: THE SITE IS AT THE VERY BOTTOM OF THE THAMES RIVER WATERSHED. THE SMALL INCREASE IN PEAK FLOW WILL NOT INCREASE THE POTENTIAL OF DOWNSTREAM FLOODING.
